LMP8645/LMP8645HV Precision High Voltage Current Sense Amplifier

Literature Number: SNOSB29E

LMP8645/LMP8645HV

Precision High Voltage Current Sense Amplifier

General Description

The LMP8645 and the LMP8645HV are precision current sense amplifiers that detect small differential voltages across a sense resistor in the presence of high input common mode voltages with a supply voltage Range from 2.7V to 12V.

The LMP8645 accepts input signals with common mode voltage Range from -2V to 42V, while the LMP8645HV accepts input signal with common mode voltage Range from -2V to 76V. The LMP8645 and LMP8645HV have adjustable gain for applications where supply current and high common mode voltage are the determining factors. The gain is configured with a single resistor, providing a high level of flexibility, the accuracy could be as low as 2% (max) including the gain setting resistor. The output is buffered in order to provide low output impedance. This high side current sense amplifier is ideal for sensing and monitoring currents in DC or battery powered systems, excellent AC and DC specifications over temperature, and keeps errors in the current sense loop to a minimum. The LMP8645 is an ideal choice for industrial, automotive and consumer applications, and it is available in TSOT-6 package.

Features

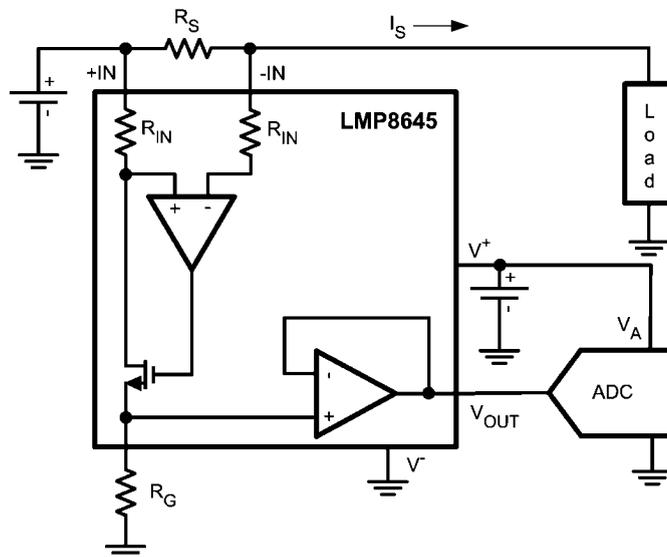

Typical values, $T_A = 25^\circ\text{C}$

- High common-mode voltage Range
 - LMP8645 -2V to 42V
 - LMP8645HV -2V to 76V
- Supply voltage Range 2.7V to 12V
- Gain configurable with a single resistor
- Max variable gain accuracy (with external resistor) 2.0%
- Transconductance 200 $\mu\text{A/V}$
- Low offset voltage 1 mV
- Input bias 12 μA
- PSRR 90 dB
- CMRR 95 dB
- Temperature Range -40°C to 125°C
- 6-Pin TSOT Package

Applications

- High-side current sense
- Vehicle current measurement
- Motor controls
- Battery monitoring
- Remote sensing
- Power management

Typical Application

Absolute Maximum Ratings *(Note 1)*

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

ESD Tolerance *(Note 2)*

| | |

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not guaranteed. For guaranteed specifications and the test conditions, see the Electrical Characteristics Tables.

Note 2: Human Body Model, applicable std. MIL-STD-883, Method 3015.7. Machine Model, applicable std. JESD22-A115-A (ESD MM std. of JEDEC) Field-Induced Charge-Device Model, applicable std. JESD22-C101-C (ESD FICDM std. of JEDEC).

Note 3: The maximum power dissipation must be derated at elevated temperatures and is dictated by $T_{\text{J(MAX)}}$, θ_{JA} , and the ambient temperature, T_A . The maximum allowable power dissipation $P_{\text{D(MAX)}} = (T_{\text{J(MAX)}} - T_A) / \theta_{\text{JA}}$ or the number given in Absolute Maximum Ratings, whichever is lower.

Note 4: Electrical Table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that $T_{\text{J}} = T_A$. No guarantee of parametric performance is indicated in the electrical tables under conditions of internal self-heating where $T_{\text{J}} > T_A$.

Note 5: Typical values represent the most likely parametric norm at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration. The typical values are not tested and are not guaranteed on shipped production material.

Note 6: All limits are guaranteed by testing, design, or statistical analysis.

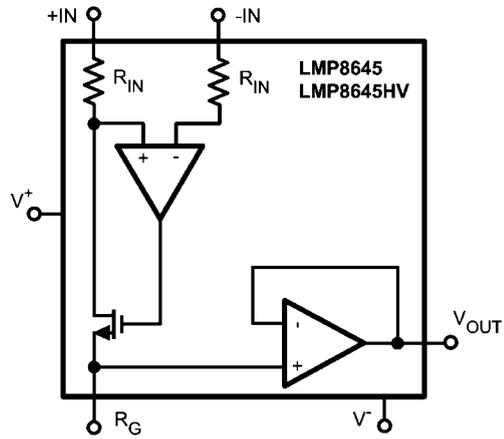

Note 7: Offset voltage temperature drift is determined by dividing the change in V_{OS} at the temperature extremes by the total temperature change.

Note 8: The number specified is the average of rising and falling slew rates and measured at 90% to 10%.

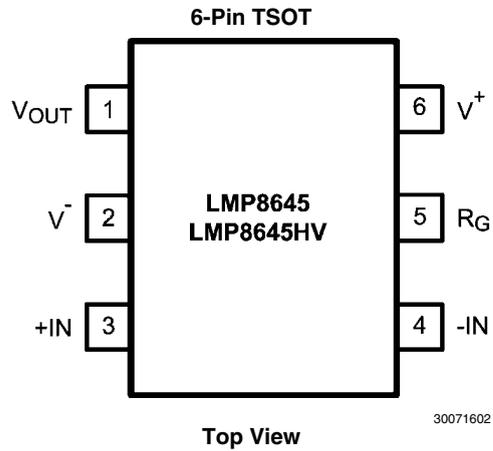

Note 9: This parameter is guaranteed by design and/or characterization and is not tested in production.

Note 10: Positive Bias Current corresponds to current flowing into the device.

Application Information

GENERAL

The LMP8645 and LMP8645HV are single supply high side current sense amplifiers with variable gain selected through an external resistor and a common mode voltage Range of -2V to 42V or -2V to 76V depending on the grade.

The sense voltage is amplified by a user-selected gain and level shifted from the positive power supply to a ground-referred output.

THEORY OF OPERATION

As seen from the picture below, the current flowing through R_S develops a voltage drop equal to V_{SENSE} across R_S . The high impedance inputs of the amplifier doesn't conduct this current and the high open loop gain of the sense amplifier forces its non-inverting input to the same voltage as the inverting input. In this way the voltage drop across R_{IN} matches V_{SENSE} . A current proportional to I_S according to the following relation:

$$I_S' = V_{SENSE}/R_{IN} = R_S * I_S / R_{IN}, \text{ where } R_{IN} = 1/Gm$$

flows entirely in the external gain resistor developing a voltage drop equal to

$$V_G = I_S' * R_{GAIN} = (V_{SENSE}/R_{IN}) * R_{GAIN} = ((R_S * I_S)/R_{IN}) * R_{GAIN}$$

This voltage is buffered and showed at the output with a very low impedance allowing a very easy interface of the LMP8645 with other ICs (ADC, $\mu C...$).

$$V_{OUT} = (R_S * I_S) * G, \text{ where } G = R_{GAIN}/R_{IN}$$

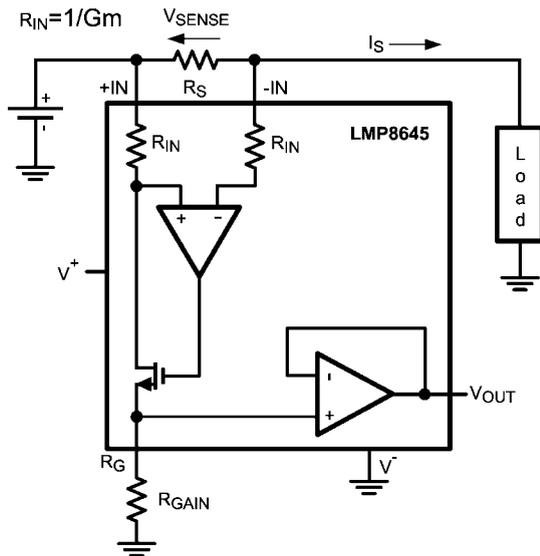

FIGURE 1. Current monitor

SELECTION OF THE SHUNT RESISTOR

The accuracy of the current measurement strictly depends on the value of the shunt resistor R_S . Its value depends on the application and it is a compromise between small-signal accuracy and maximum permissible voltage loss in the measurement section. High values of R_S provide better accuracy at lower currents by minimizing the effects of offset, while low values of R_S minimize voltage loss in the supply section. For most applications, best performance is obtained with an R_S

value that provides a full-scale shunt voltage Range of 100 mV to 200 mV.

SELECTION OF THE GAIN RESISTOR

In the LMP8645 and LMP8645HV the gain is selected through an external resistor connected to the R_G pin. Moreover the gain resistor R_{GAIN} determines the voltage of the output buffer which is related to the supply voltage and to the common mode voltage of the input signal. The gain resistor must be chosen such that the max output voltage does not exceed the LMP8645 max output voltage rating for a given common mode voltage.

The following equations explain how to select the gain resistor for various Range of the input common mode voltage.

$$\text{Range 1 } -2V < V_{CM} \leq 1.8V$$

The max voltage at the R_G pin is given by the following inequality $V_{RG} = V_{sense} * R_{GAIN} * Gm \leq \min(1.3V; V_{out_max})$ where V_{out_max} is the maximum allowable output voltage according to the Electrical Tables. All the gain resistors (R_{GAIN}) which respect the previous inequality are allowed. The graphical representation in Figure 2 helps in the selection; all the combinations (V_{SENSE} , R_{GAIN}) below the curve are allowed.

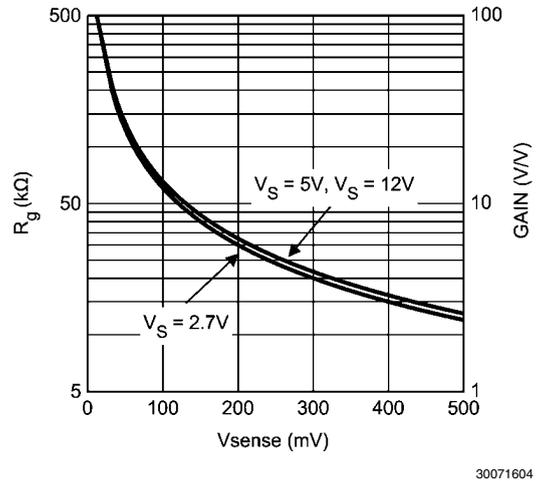

FIGURE 2. Allowed Gains for Range 1

As a consequence once selected the gain (R_{GAIN}) the V_{SENSE} Range is fixed too. For example if an application required a Gain of 10, R_G will be 50 k Ω and V_{SENSE} will be in the Range 10 mV to 100 mV.

$$\text{Range 2 } 1.8V < V_{CM} \leq V_S$$

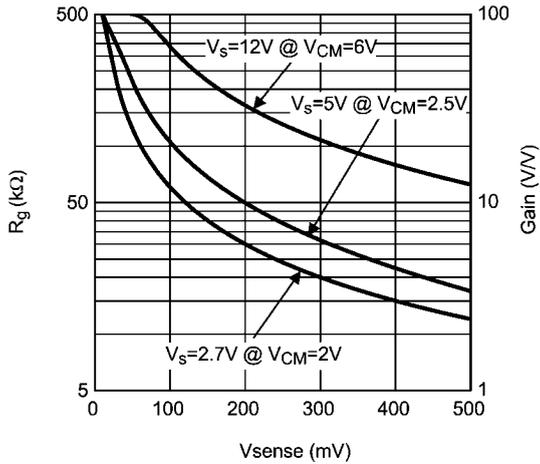

In this Range the max voltage at the R_G pin is related to the common mode voltage and V_{SENSE} . So all the R_{GAIN} resistors which respect the following inequalities are allowed:

$$V_{RG} \leq \min(V_{out_max}; (V_{CM} - V_{sense} - 250mV))$$

where

$V_{RG} = V_{SENSE} * R_{GAIN} * Gm$ and V_{out_max} is the maximum allowable output voltage according to the Electrical Tables.

The graphical representation in Figure 3 helps in the selection; all the combinations (V_{SENSE} , R_{GAIN}) below the curves for given V_{CM} and supply voltage are allowed.

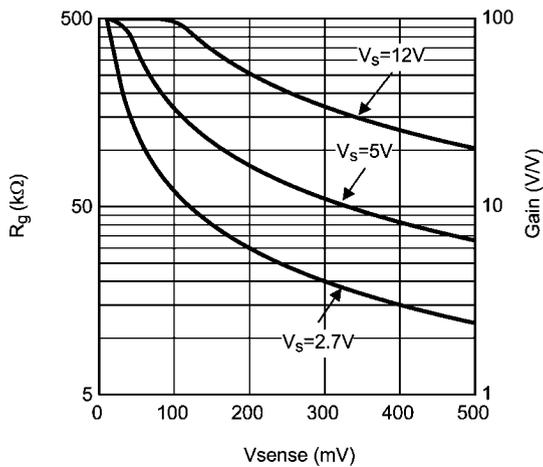

30071605

FIGURE 3. Allowed Gains for Range 2

Also in this Range once selected the R_{GAIN} (Gain) the V_{SENSE} Range is fixed too.

$$\text{Range 3 } V_{CM} \geq V_S$$

The max voltage at the R_G pin is V_{out_max} , it means that $V_{OUT} = V_{SENSE} * R_{GAIN}/R_{IN} \leq V_{out_max}$ where V_{out_max} is the maximum allowable output voltage according to the Electrical Tables. So all the R_{GAIN} resistors which respect the previous inequality are allowed. The graphical representation in helps in the selection; all the combinations (V_{SENSE} , R_{GAIN}) below the curves are allowed.

30071606

FIGURE 4. Allowed Gains for Range 3

Also in this Range once selected the R_{GAIN} (Gain) the V_{SENSE} Range is fixed too.

From the Ranges showed above a good way to maximize the output voltage swing of the LMP8645 is to select the max allowable R_{gain} according to the previous equations. For a

fixed supply voltage and V_{sense} as the common mode voltage increases, the max allowable R_{gain} increases too.

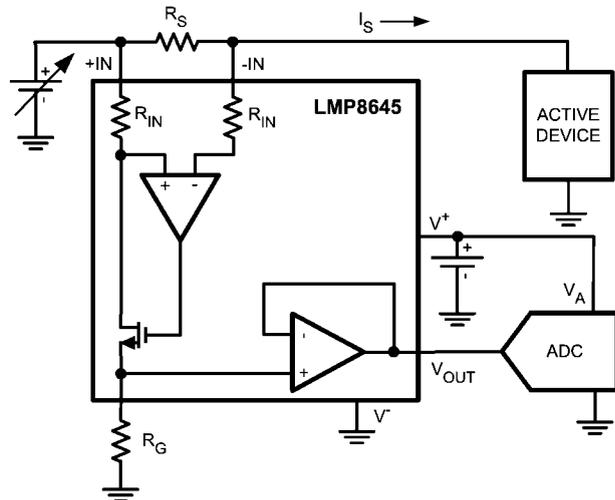

DESIGN GUIDELINE

Example 1

The LMP8645 is used to monitor the current supply of an active device (Refer to Figure 5). The LMP8645 is supplied at 5V the active device is supplied at 12V and the max current sunk is 1A. In this example the LMP8645 will work in all 3 Ranges: in Range 1 at the turning on of the active device, then in Range 3 passing through the Range 2. Since the purpose of the application is monitor the current of the active device in any operating state working condition (power on, normal operation, etc.), the gain resistor will be selected according to the Range 1, the Range which gives more constraints to the output dynamic voltage of the LMP8645.

At the startup of the monitored device the LMP8645 works at 0V common mode, it means that its max output is 1.3V (Range 1). In order to maximize the resolution the R_{sense} is calculated as max allowed V_{sense} (Refer to Figure 2) divided by max current (1A), so $R_{sense}=0.5\Omega$. Due to the output limitation the max allowed gain will be $2.6V/V$ so $R_{GAIN}=13k\Omega$. With this approach the current is monitored at any working condition but without using the entire output dynamic of the LMP8645. Alternatively if the monitored device doesn't sink 1A at any supply voltage, it is possible to design considering the max output voltage of the LMP8645 when operating in Range 3 ($V_{CM} \geq V_S$). Also in this case is possible to maximize the resolution using $R_{sense}=0.5\Omega$, and maximize the output dynamic with $R_{gain}=33k\Omega$. With this approach the max detectable current when V_{CM} is less than 1,8V is about 400mA, while for $V_{CM}=2.5V$ the max detectable current is 600mA (Refer to Figure 2) and for $V_{CM} \geq V_S$ is 1A.

The second approach maximizes the output dynamic but implies some knowledge on the monitored current.

FIGURE 5. LMP8645 in current monitor application

Example 2

The LMP8645 is used to monitor the current in a high brightness LED application together with LM340x LED drivers. The LMP8645 is supplied at 3.3V and the max voltage at LED's string is 30V, the LED brightness is controlled with the dimming (MOSFET in parallel to the LED). The approach of the high current sense is used especially in automotive application where the cathode of the LED needs to be directly connected to the chassis of the car (Ground of the system). Even though LMP8645 will work in all 3 Ranges as in the previous example, R_{GAIN} will be calculated according to Range 3 because the purpose is regulating the current in the LEDs when the external MOSFET is OFF (LMP8645 at high V_{CM}). Even if this approach makes the LMP8645 able to sense high peak current only in Range 3 where the dynamic output is higher than Range 1 the current resolution is maximized. At each switch ON/OFF of the MOSFET the LMP8645 goes from Range 1 (MOSFET ON, string of LED OFF), to Range 3 (MOSFET OFF, string of LED ON) passing through Range 2 (MOSFET OFF, string of LED OFF). Since the purpose of the application is to sense the current with high precision when the LED string is ON, the R_{GAIN} will be calculated according to the Range 3.

To summarize, the R_{GAIN} will be calculated according to the range of operation in which the application will mainly work. Once selected the range, will be taken in account the more stringent constraint

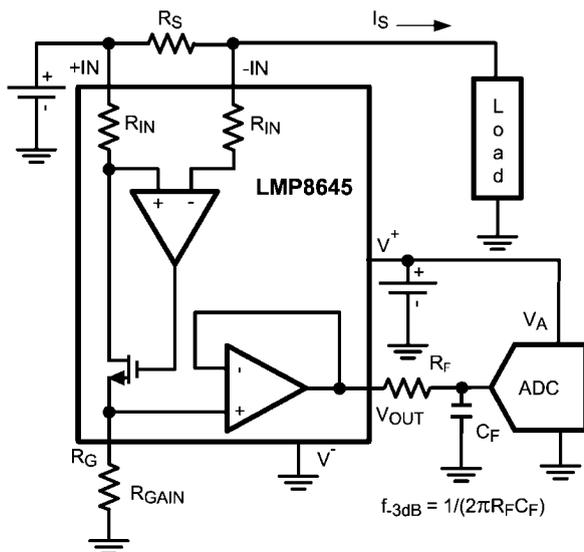

DRIVING ADC

The input stage of an Analog to Digital converter can be modeled with a resistor and a capacitance versus ground. So if the voltage source doesn't have a low impedance an error in the amplitude's measurement will occur. In this Range a buffer is needed to drive the ADC. The LMP8645 has an internal output buffer able to drive a capacitance load up to 30 pF or the input stage of an ADC. If required an external low pass RC filter can be added at the output of the LMP8645 to reduce the noise and the bandwidth of the current sense. Any other filter solution which implies a capacitance connected to the R_G pin is not suggested due to the high impedance of that pin.

SENSING CURRENT IN LED DRIVER APPLICATIONS

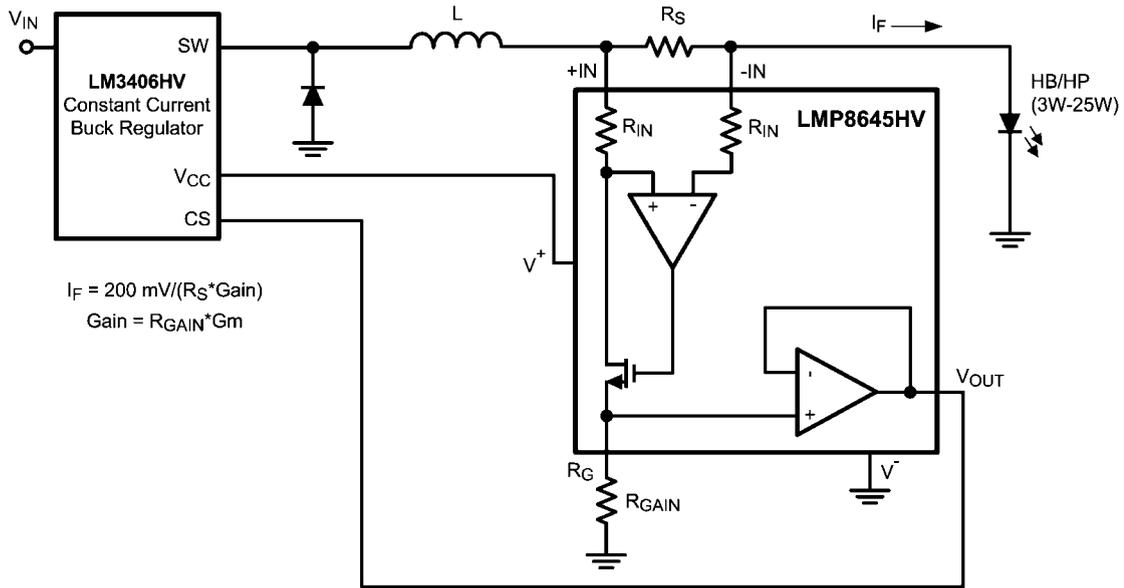

The LMP8645 is the right choice in the applications which requires high side current sense, such as High Brightness LED for automotive where the LED's cathode has to be connected to the Range (ground) of the car. In this Range the classical low side current sense with a shunt resistor connected between the LED's cathode and the Range doesn't guarantee the ground connection. In *Figure 7*, the LMP8645 monitors the current for the LM3406 a constant current buck regulator. The LMP8645 is supplied by the internal LDO of the LM3406 through the pin VCC, the current which flows in the LED is programmed according the following formula: $I_F = V_{CS} / (R_S * Gain)$, where $Gain = R_{GAIN} * G_m$ and $V_{CS} = 200\text{ mV}$. In this application the current which flows in the HB LED is in the Range between 350 mA and 1A, so in order to reduce the power dissipation on the shunt resistor and have a good accuracy, the R_S should be in the Range between 50 mΩ and 200 mΩ. In the table below two examples are analyzed.

| | $I_F=350\text{mA}$ | $I_F=1\text{A}$ |
|------------------------------|--------------------|-----------------|
| R_{GAIN} | 40kΩ | 36kΩ |
| R_S | 77mΩ | 27mΩ |
| Dissipated Power | 9.5mW | 27mW |
| Total Accuracy | ≈5% | ≈5% |

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
